## Catalogue and price list

 STEREOPTICONS,Dissolving Views, Apparatus, Magic Janterns, and Artistically Colored Photographic Views.

That eminent Philosopher, Sir David Brewstir, says, "The Mratic Lantern, which, for a long time was usfd only as an ins'rument for amusing childrrn, and astonishing the ignorant, has recently been fitterl up for the better purpose of conveying Scientiftc Instruction, and it is now universally used by popular Lecturers. It m:y be used in almost every by anch where it is desirable to give a distinct and entarged representa'ion to a large audience."

##  <br> 49 NASSAU STREET: <br> Between Maiden Lane and Liberty Street, <br> > NEW YORK. <br> <br> NEW YORK.

 <br> <br> NEW YORK.}This Catalogue is printed for gratuitous distribution, and sent by 通aill free of charge.

[^0]Within 8 few years past the beautiful art of Photographing on Glass has been brought to a high state of perfection; and by its ald the Magic Lantern, which liad been so long regarded as a mero toy for the amusement of children, has been raised to the character of a Scikntific Instrument, ealculated to be of vast service in the instruction of youth, and the eutertalument of the family checls, or as a beautiful and refining recreative exhlbition to an intelligent audience.

This Catalogue containg a itst of over two thousand Views, carciully photographed on glass, from the fuest engravings to be procured, and colored by experienced artists, with the most brilliant and appropriate tints necessary to their proper representation.

EACH VIEW, HXCEPT WHEN OTHERWISE DESCRIBED, IS UPON A GLASK PLATE THRER INCHES IN DIameter, with a covering glasb to protect it from careless handlino, and each view is MOUNTED SEPARATELY, IN A MAHOGANY FRANEE OF FOUR INCHES WIDE AND GEVEN INCHES LONO.

The choicest works of art-master pleces of Raphael, Rubens, and all the celebrated Painters of ancient and modern times; Illustrations of Travels and Voyages; Scriptural Scenes; Historical Subjeats: The Battles, Sieges and important events of our Civil War; Portraits of Prominent Characters, etc., etc., will be found ciassified under separate heads.

There are no subjects, howover intricate, that may not thus be readily fllustrated, and the superior otyle of painting in which the views are executed, classes them as genuive works of art.

The Bfautifui Stereoscoplc Views on Glass, in a Lantern illuminated by the Oxy-Hydrogen or the Uxy-Calcium light, can be exhibited on a screen from fifteen to thirty feet square, covering an area of from 200 to 900 square feet, with a perfectiy natural Stereoscopic effect. When two Lanterng thus illuminated are used to produce the Dissolviug Views, the instrument is called "The Stereopticon." These Dissolving Vlews whether with the above Stercoscopic Views, or with the finely colored Circular Vtews constitute the most attractive exhibition that can be offered to an educated public.

The novel effect of "dissolving" one city into another-New York into London-London fnto Parls -Paris into Rome, etc.-the exterior of a buflding into the interior of the same buildiug-ehanging a emiling summer landscape to a snowy winter scene, etc., etc.-and all in so gradual a manner as always to leave a picture before the audience, produces a magical effect that never fails to please.

While the character of the Paintings has thus improved and driven out the miserable caricaturea formerly to be met with, the optical and mechanical portions of the apparatus have likewise advanced, so that more perfect effects can be obtained than with the old-fashioned Lanterns, aud at the samo time with far more convenience and ease to the operator.

Every Lantern and Stereopticon sold by me is fitted with McAllister's New Slide Spring and Stop, by which the sliders are securely held in the central line of the lenses; an invention simple in construction, but the great importance of which is acknowledged by all who have seen it.

In the education of youth, the value of pictorial representations is known and appreciated as a most efficient mode of fixing ideas in the mind; and, the assortment of Views now presented will enable a skillive insiructor to illustrate many subjects which have heretorore been supposed impossible to be explained other than orally, and to convey many lessons of vital importance in a most forcible manner; while the fascinating character of the exhibition will give a charm to what would othersise be considered a "dry lecture."

Enilghtened teachers have already appreciated the advantages of the now Improved Scientifio Magic Lantern, and it is being rapidly introduced into our Colleges, Acadiemies and Schools, as a necessary ediucational adjunct.

It is also assuming a position as a fashionable and elegant Parlor Entemtainament for private familles.

As an attractive POBLIC Expibition, it is found, when properly managed, to prove a remunerative aud picasant business, and offers great inducements to a man with moderate capital.

Of all the different Lanterns now in use, we recommend for general use the instruments supplied with what is called the Oxy-Calcium Light, in whtch a spirit flame furnishes the hydroger gas, through which a jet of oxygen gas is conducted on a lime cylinder. This light is 100 times more inteuse than that of the oll lamp, and is without any danger, as olly one gas is used-the oxygen-which, by itseif, is Incombustible. The brilliant efiect produced by this Oxy-Calcium Light ie sufficient to make the pictures up to 18 feet in diameter-in fact, to give exhlbitions in the largest halls.

The Oxy-Hydrogen, or Drummond Light Apparatus, although giving a still more fintense light thai the forecolng Oxy-Calctum Jight, is more complicated, and requiree moreskiliul management

The Stereopticons, \& Lantcirs arc priced without any reference to Slides whatcear, That is, the prices are for the Stereopticons and Lanterns complete and ready for use, with Lamps and necessary appendages, but without any Views.

## 0XY-HYDROGEN STEREOPTICON.

The Oxy-Hydrogen or Drummond Light, is the invention of the late Prof. Robt. Hane, M.D. of the University of Pennsylvania, and is produced by the ignition of lime in a compound tlame of Oxygen and Hydrogen Gases. The light thus obtained is the most intense, as yet discovered, that can be practically applied, and is at the same time easily and economically procured; the entire expense of making the Gases for an evening's exhibition, with either of the following Oxy-Hydrogen Stereopticons, being under One Dollar, even at the present high price of chemicals.

ST The Oxy-Hydrogen apparatus, as heretofore made, has not been free from danger, and accidents have occurred. I have recently introduced several improvements in the arrangements of the apparatus, by which all danger is removed, and the greatest amount of light obtained with absolute safety to the operator.

No. 400. Oxy-ETyarogen or Drummond Light Stereopticon, for Dissolving Views, with Improved arrangement for producing the dissolving effect.
The cases of finely-finished and well-seasoned mahogany, on raised Walnut Platform. Con densing Lenses $4 \frac{3}{2}$ inches diameter. First quality Acnromatic Combination Magnifying Lenses, of two powers, with Brass Rack work adjustment for focussing. Wir: yuality Oxy Hydrogen Safety Jets tipped with Platina. McAllister's new Slide Spring and Sto Retort, Purifier, and largest size India Rubber Gas Bag, for the Oxygen. Copper Generator nd largest size Gas Bag for the Hydrogen.
This instrument is made throughout in the very best manner, adapte. 1 for use in the largest Halls, and will magnify the Stereoscopic Views on Glass up to 25 feet square ( 625 square fert), with fine defintion and powerful light.
Securely packed in strong boxes, with hinged lid, lock and key and handles.

No. 401. Same as above, with clock work to move the lime...... $\$ 40000$
No. 402. Oxy-Hydrogen, or Drummond Light Stereopticon, for Dissolving Views.
In Japanned Cases-Condensing Lenses, 4 inches diameter-High Power and Medium Power Magnifying Lenses, with Brass Rack adjustment for focussing. McAllister's new Slide Spring and Stop. Improved Safety Jets, Retort, Puritier, and largest size India Rubber Bag for the Oxygen. Copper Generator, and largest size India Rubber Bag for the Hydrogen.
Securaly packed in strong locked box, with iron handle.............................
. $\$ 20000$
\#o. 403. Same as No. 402, but with Achromatic Combination Magnifying

Ench of the Oxy-Hydrogen Stereopticons is provided with an improved Dissolving arrangement, by which a great saving of the Gas is effected. Also with Blue Glass and Red Glass Diaphragms, for producing sunset and moonlight effects, colored ground for statuary, etc.
The Achromatic Lenses make the picture clear. with the outlines sharply defined. and free from the prismatic, or rainbow colors, so often seen in pictures magnified with ordinary lenses.
The high magnifying power is used when the screen is obliged to be placed near the instrament. The low power, when the screen can be placed at a greater distance.

The low power makes a picture of the same size as the high power, when the distance is coubled, thus adapting the instrumeuts to halls of any size.

The Copper Hydrogen Generator, which accompanies each of the above, fs to be used for making the Hydrogen Gas, when giving exhibitions in places where there are no Public Gas Works. But where these exist, the Hydrogen Bag can be readily tilled by making an attachment to a Barner.

Each instrament is farnished with complete instructions for its management.

## OXY-CALCIUM STEREOPTICON.

The Oxy-Calcium, or as it is sometimes called The "Bude" light, is inferior to the Oxy-Eydrogen, though still far more intense than the most brilliant Oil Lamp. It differs from the OsyHydrogen, in using but one Gas, Oxygen ; the flame of an alcohol lamp, replacing the Hydrogen. The Oxy-Calcium apparatus is more compact and more portable than the $O x y$-Hydrogen, more simple. and easier to manage. It will illuminate any of the Photographic Views brilliantly, when magnified up to as much as 15 feet in diameter ( 225 square feet).

No. 410. Oxy-Calcium Stereopticon, for Dissolving Views:
Consisting of two Lanterns, in Japanned cases, 10 by 8 inches square and 16 inches high, with McAllister's Improved Adjustable Oxy-Calcium Jets-Condensing Lenses 4 inches diameter -High Power and Medium Power Magnifying Lenses, with Brass Rack adjustments, for focussing. McAllister's new Slide Spring and Stop. Retort, with Iron Stand and Spirit Lamp, Purifier, India Rubber Gas Bag, and Flexible India Rubber Tubing for the Oxygen-and apparatus to produce the Dissolving effect.

Packed in smoothly finished locked and ninged box 24 inches square. The lid of the box serves for a platform for the apparatas when exhibiting........................................... 13000

## Fo. 411. Same as No. 410, but with Achromatic Magnifying Lenses, \$150

## No. 412. Oxy-Calcium Stereopticon, for Dissolving Views:

Consisting of two Lanterns, in Japanned cases, 10 by 8 iuches rquate and 16 inches high, with Mcallister's improved Adustable Oxy-Calcium Jets-Condensing Lenses ${ }^{1} \frac{1}{2}$ inches in diam-eter-High Power and Medium Power Magnifying Lenses, with brass Rack adjustment, for focussing. McAllister's new Slide Spring nul Stop. Gas A pparatus and Dissolving Apparatus, etc., as No. 410.
$\$ 12000$
No. 413. Same as No. 412, but with Achromatic Magnifying Lenses. \$140

## OXY-CALCIUM STEREOPTICONS, WITH HYDROGEN ATTACHMENT.

As almost every village and town is now supplied with Public Gas Works (furnishing Carburetted Hydrogen Gas), I have contrived a new pattern of Oxy-Calcium Atercopticon with an attachment to connect with any Gas Burner, and use this Gas in place of the Alcohol. The light is more intense than when Alcohol is used, is more uniform, and more easily managed. In places where there are no Gas Works Alcohol can be used (as in Nos. 410 to 413,) without any alteration of the opparatus.

```
No. 414. Same as No. 410, with Hydrogen Attachment.............$150 00
No. 4.15. Same as No. 411, with Hydrogen Attachment.............$170 00

Condensing Lenses 4 inches in diameter-High Power and Medium Power Magnifying Lenses, Tin Sliding Tube adjustment, for focussing. Mcallister's new Slide Spring and Stop. Retort, etc., for the Oxygen.
.\$7500

## MANAGEMENT OF THE OXY-CALCIUM APPARATUS.

Fill the Reservoir (A, fig. 421 page 8) to within an inch of the top, with the best alconol, and have a good thick wick 3 or 4 inches long, in the tube of the lamp, projecting about half an inch, and trimmed even.

The alcohol should always be of at least 90 per cont. purity. A percentage Hydrometer is furnished with each apparatus, with instructions for use; by which the purity, of the alcohol can be tested when purchasing.

A cylinder of hard unslacked lime must next be placed in the lime-carrier, immediately in the rear of the flame, and is to be thoroughly heated by the flame before the oxygen is turned on. (if the oxygen is turned on too soon, the lime will crack from the sudden increase of heat.) Having the Bag of Oxygen in a convenient position on the fioor, in front of the apparatus, place about 150 pounds weight on the Pressure Board, and make the attachments with the flexible India Rubber Tubing. (In Nos. 416 to 42 .) the connection is made directly from the bag to the jet, but in Nos. 410 to 415 the bag is connected with the jets by the medium of the Dissolving Key.) The stop-cock at the bag should now be turned on, and the flow of gas regulated by the small stop-cock attached to the jet. The wick of the lamp must be spread out slightly, so as to leave a free passage for the gas from the jet through the flame-the smallest fibre of the wick in front of the jet will prevent the flow of the gas, lessen the light, and cause a slight hissing noise. The lime is next to be adjusted by sliding the lime-carrier to or from the flame, and moving the lime cylinder up or down, until the light is most brilliant.
It merely remains to place a view in the lantern, adjust the focus, and move the jet backward or forward, and center it until there is an equally intense illumination over all parts of the magnified picture. The jet once in its position is to be held ? there by the centering and elevating screws.

The Dissolving effect in the Stereopticons is produced by moving the lever of the Dissolving Key, transferring the Oxygen from one lantern to the other, thus causing the light to increase in one lantern, in the same proportion as it decreases in the other lantern, and the paintings will gradually and beautifully dissolve.

Each lantern of the Stereopticon turns upon a pivot in front, and the Lanterns are to be inclined apart at the rear, to such an angle that the circle of light from each shall fall precisely upon the same space on the screen.

## DIRECTIONS FOR MAKING THE OXYGEN GAS.

(The illustration on page 8 represents the apparatus, the Pressure Board, of eourse being removed when making the Gas.)

Place in the Retort 16 ounces of Chlorate of Potach, in coarse powder, and add to it 6 ounces of Black Oxide of Manganese. Shake the Retort, that the iagredients may be well mixed.

Next, blow through all the pipes and connections, so as to satisfy yourself that there is nothing to obstruct the free passage of the Gas.

Pour about one pint of water into the wash bottle, and fit the metal pipe into the opening at the top; this pipe is connected by the India Rubber Tubing with the longer metal pipe which you now fit into the top of the retort. Press these pipes, and the fittings will be completely gas-tight.

Light the spirit lamp under the Retort, and in a few minutes bubbles of gas will begin to come up through the water in the Wash Bottle, and the Wash Bottle is now to be connected with the Gas Bag by the piece of India Rubber Tubing, as shown in the illustration.

If the Gas comes over too violently, remove the lamp and replace it when the flow of gas becomes more moderate, and keep it under the retort until the bubbles cease to come over.

You then turn the cock at the Bag-detach the Bag from the Wash Bottle. Next remove the metal pipe from the Wash Bottle-and, last of all, remove the Spirit Lamp.

When the Retort has cooled, wash out the residuum in the Retort, and stand the Retort upside down, tiat it may be entirely dry before it is used again, as it is absolutely necessary that there shall be no moisture in the lietort while the Gas is being made. With good chemieals the Bag can be filled with Gas in about twenty minutes.

Failures often occur from using impure chemicals. To test them, melt a small quantity of the Chlorate of Potash, ia an iron spoon, over a Spirit Lamp, and stir into it with an iron wire some of the Black Oxide of Manganese.

If the materials are not good an explosion will take place, and a whitish mass with red spots in it will be left in the apoon,--if they are pure, there will be no explosion, and the melted mixture will soon dry up, leaving a dark gray residuum.

For price of Chemicals, etc., see price list on page 48.

PRESSURE BOARDS.-All the Oxy-Hydrogen and Oxy-Calcinm Stereopticons and Lanteras are furnished complete, with every necessary except the Pressure Boards for the Gas Baga; and these can be made by any carpenter at a less cost than the express charge on them would amount to.

GAS BAGS.-The India Rubber Gas Bags will contain enough Gas for an evening's exhibition, lasting from one hour and-a-half to two hours, according as a greater or less pressure is placed apon the bag. The greater the pressure, the more gas will be consumed in a given time. Extra large Gas Bags, or two Gas Bags can be furnished at an extra cost.

No. 421. McAllister's Improved Aãjustable Oxy-Calcium Jet.
This Jet is very simple in its construction. and far superior to the complicated Oxy-Calclum iets formerly used. It is mounted on a walnut base, 4 inches wide by 12 inches long. Has stop-cock to control the flow of gas, elevating and centering screw, etc. Can be readily applled to any lantern.

No. 422. Orygen Apparatus, consisting of Retort, with Spirit Lamp, Purifier India Rubber Gas Bag, with Stop-Cools

No. 423. The Oxygen Apparatus, No. 422. with two of the Oxy-Calcium Jets, No. 421, and Dissolving Apparatus.
By asing this, a pair of the usual Dissolving Lanterns can be converted into an Oxy-Caleinm Stereopticon.
. 9000

## DISSOLVING VIEW APPARATUS WITH COAL OIL LANIP. <br> 

No. 425. A Pair of Dissolving View Phantasmagoria Iranterns, in Japanned Cases, 10 by 8 inches square, and l6 inches high.
Condensing Lenses 4 inches in diameter; high power and medium power Magnifying Lenses; Brass Rack work adjustment for focussing. McAllister's new Slide Spring and Stup. Coal Oil Lamps, with apparatus for producing the Dissolving effect. Packed in box 24 inches square, with hinged lid, lock and key and handles. To produce the Dissolving effect requires two lanterns arranged on a stand, as shown in the engraving. Each Lantern turns upon a pivot in front. Incline both Lanterns apart at the rear to such an angle that the circle of light from each shall fall precisely upon the same spot on the sereen. There is in front of the pair of lanterns a diamond-shaped shade, which slides in a groove. and is so proportioned that when the wide part is in front of the tube ot one lantern, the pointed end will not quite reach to the front of the tube of the other lantern. Having placed a slider in each lantern, slide the sliade along the grove, by the hand, altermately from right to leit. and leit to right; and it follows, that as soon as the shade begins to cover the image proceeding from one lantern a corresponding portion of the image proceeding from the other lantern is thrown upon the screen. The movement should be slow ancl regular, and the paintings will inperceptibly and beautifully dissolve, the one into the other.
It is of much consequence that the paintings are placed precisely in the centre of the lenses. so that they nay fall directly upon each other when the change is made. The paintings also must each be mounted in a separate slider; and as the space between the lanterns is slight, (see engraving, the slider must not be more than 7 inches in length. All sliders, therefore, which are over 7 inches in length cannot be used to produce the dissolving effect.

The "Paintings in Pairs, or sets, for Dissolving Views," are painted with express reference to the production of fine effects, though any two paintings of the same size will answer for dissolving, care being taken that there is a general likeness of light and sliade. For instance, a painting having a very light object in its centre will not dissolve handsomely into another painting having a very dark object in the centre.
Striking and amusing effects, however, are often produced by dissolving with paintings of entirely different character, and the unexpected change will excite and keep up the intereat of an audience-thu* a landscape may dissolve into a chromatrope or a portrait; or a comic figure may, by the dissolvlng arrangement, be introduced into a landscape, etc.

## SINGLE MAGIC LANTERNS, with COAL OIL LAMPS,

No. 430. Improved Phantasmagoria Iantern, in Japanned Case, 10 by 9
Condensing Lenses 4 inches in diameter. High nower and medium power Magnifying Lenses, Brass Rack work adjustment for focussing. MeAllister's new slide Spring and sitop. Coal Oil damp. .$\$ 3500$

Adustment, for focussing............................................................. 00

## GENERAL DIRECTIONS FOR THE USE OF THE MAGIC LANTERN.

The following directions are intended merely as a guide to those unacquainted with the management of the Magic Lantern. Practice will soon suggest to the operator many methods of rendering the exhrbition a pleasant and profitable amusement.
The lanip should be carefully trimmed, and filled with the best oil, the flame to stand as high as possible, so that it does not smoke. The greatest cleanliness should be observed with the lamp, and when not in use the oil should be drained out.
All the lenses should be taken out previously to each exhibition, and carefully wiped out with a soft muslin or linen cloth.
The room being fully darkened, the lantern should be placed upon a table, about six or eight feet from a white wall, or a white sheet suspended on a wall; or it is frequently preferable to make use of a muslin screen stretched on a frame, the lantern being on one side and the spectators on the other; and it is recommended to wet the screen that it may be drawn tighter, and also rendered more transparent.
To make a waxed muslin screen, mix turpentine and white beeswax in the proportion of two parts wax and one part turpentine; heat it over a fluid lamp until all is dissolved; then in 8 warm room, apply it with a painter's brush over the screen, and afterwards smooth the screen with a common iron, heated a little-the screen should be stretched on a frame. This makes an excellent screen when you want to have your lantern behind the screen; the glare of the lamp does not come through, but it cracks and becomes yellow if kept folded up, gets dirty very easily, and is troublesume to prepare.
The lamp having been lighted and placed in the lantern, close the door of the lantern and move the lamp backwards or forwards until a perfect circle is formed on the wall or screen; the lamp is then known to be in its proper position-much depends upon this.
The sliders are placed in the slit in front of the lantern, with the pictnre inverted where they will be tirmly held and kept in the central line of the lenses, by Mcallister's newly invented slide spring and stop, and the focus adjusted by moving the front lenses. The farther the lantera is from the wall or screen, the larger will be the image, but the illumination will notbe so periect as when closer.

## To Produce the Phantasmagoria Effect.

The operator should be on one side of the screen, as already described, and the spectators on the other. Taking the lantern under his left arm, be should go up pretty close to the screen and adjust the focus with his right hand. The image, of course, will be verg small; he must then walk slowly backward, at the same time adjusting the focus. As the image increases in size, it will appear to the spectators to be coming towards them; and then again let him walk ap towards the screen, thas diminishong the image, and it will appear to them as if receding. The screen not being seen, the image appears to be suspended in the air, and the deception is complete, even to those accustomed to the exhibition.

Slides producing the best Pbantasmagoria effect are those containing but one or two figures, and all the rest of the glass painted black; such for instance, as some of the comic slip slides.

## PHOTOGRAPHIC SLIDERS.

Constantly on hand a very large assortment of bexutifully executed Photographic Sliders, elucidating every branch of popular knowledge, and evevy department of pū̄lic interest, to which the attention of Teachers, S'uperintendents of Sunday Schools, and Public Lecturers is invited.

##  es in diameter, abidis mounted separedely, in a mahogany frame of four inches wide and sevenimelies lomy.

## Views of the American Civil War. <br> \$2.75 per slide.

## Photographed from the Best Pictures to be obtained, and Finely Colormd, Arravged in Five Parts. <br> A-The prominent events, Battles, Skirmishes, etc. <br> E-Incidents of Camp Life and Soldier Life. <br> C-Views of Places of Interest in connection with the Rebellion. <br> D-Pictures of an Allegorical, Emblematical and Comical charactor. <br> E -Portraits of Prominent Officers.

This series of Views of the War has been selected with great care from a collection of aboat 1000 views: it comprises illustrations of all the prominent events of the war which will remaio as permanent matters of history, and omitting those minor events which were merely of temporary importance.
These views can be shown with any of the Lanterns; bnt to give the most perfect satisfaction, and bring out all the details of the views, they require the Oxy-Calcium or Oxy-Hydrogen light

" to give Firework effect...................................................................... 5 . 00
- to give Aurora effect.

These may be used in combination with any of the Dissolving sets where such effects may be desirable.

\section*{CHROIIATROPES, OR ARTIFICIAL FIRE-WORKS.}

These Sliders are singularly curious, the effect being very similar to that of the Kalcidoscope. The pictures are produced by brilliant designs being painted upon two circular glasses, and the glasses being made to rotate in different directions. An endless variety of changes in the pattern are caused by turning the wheel-sometimes slowly-then quickly-backward-and forward.
"The National Flag," Chromatrope.- \(\$ 500\) Each.
From designs expressly made to introduce the colors of our glorious National Flig. Five different patterns of this chromatrope.
"The Geometrical" Ceromatrope.- \(\$ 00\) Each.
A variety of entirely new and original patterns, of superior Chromatic and Geometrical effectas. Twenty-ive different styles of this Chromatrope.
\[
\text { "The Washington" Chromatrope.- } \$ 550 \text { Each. }
\]

Anew and beantiful design, with a Photographic Likeness of Washington in the centre, (copied from Stuart's celebrated painting in the Boston Atheneum), and the stars and stripes revoiving around it in glotious array.
"The Lincoln" Chromatrope.-\$5 50 Each.
A correct likeness of our lamented President in the centre of a Revolving Display of brillian colora.
\[
\text { "The Good Nighi" Ceromatrope.-\$5 } 50 \text { Each. }
\]

The words "Good Night," encircled by a wreath of Flowers in the centre of a Revolving Chromatrope-very appropriate as a closing piece of an ezhibition.

\section*{SLIDES WITH REVOLVING MOTION.} \$500 per slide.
Bombardment of Fort Sumter; ihe Ironsides throwing shell.
View of Ola Ruins, which, by being \{urned around, changes to Portrait of an Old Woman.
Fiew of Rocria and Shribbery, which, by being turned around, changes to Portrait of a Satyr.
Golland Wingrell, witur Revolving Fana.
Eto., Etc., Eto

\section*{STEREOSCOPIC VIEWS 0 E WORLD-RENOWNED PLACES OF INTEREST.}

taken from nature, and prepared for the sterlopticor.
The following are Stereoscopic Views directly from nature, apon glass, transparent, expressly taken and prepared to produce a brilliant effect upon the screen, when magnified by an \(0 \times y\) Calcinm or Oxy-Hydrogen Stereopticon, with Achromatic Lenses, such as Nos. 400, 401, 403, \(411,413,415,417,419\). The light of a Coal Oil Lamp is not sufficiently intense to produce a satisfactory picture. Of the great variety of Stereoscopic Pictures the following have been selected as among the most interesting and suitable ones, and constitute what has been most appropriately called the "Stereopticon Exhibition."

44 Satan is hissed instead of applauded at the relation of his deed, and he and his host are transformed ints Serpents-B. X, 501-519.
45. Sin and Death going on their mission to !estroy-B. X, 610.

49 Moses brings down the tables of the law from Mount Sinai--B. XII, 236-239.
50 Adam and Eve expelled-B. XII, 64I-64t.

\section*{ILLUSTRATIONS TO DANTE'S INFERNO.}

\section*{By Gustave Dore.}

\section*{Finely Colored Photoorapas.- \(\$ 275\) per Slide.}

1 Portrait of Dante Aligh'eri, born 1265.
The author finds himself in a gloomy wood, astray-Canto I, lines 1-3.
Is hindered by a panter from ascending a mountain-Can. I, 29-32.
A Lion puts himself in his path in another direction-Can. I, 4344.
Dante meets the poet Virgil, who slows him the way to avoid a pursuing she-wolf-Can. I, 88-90.
- Virgil proposes to show to Dante Hell, and they depart thence--Can. I, I32.

They proceed at Nightfall-Can. II, 1-3.
The apparition of his Breatrice bids him forth on his errand-Can. II, 70-71.
9 Dante, following Virgil, comes to the Gate of Hell. They read the inscription: "All hope abandon, all ye who enter here."-Ca I. III, 9.
11 Cons
Charon compelling ungodly sonls to enter his vessel-Can. III, 101-104.
12 They see the unbaptised, who live desiring without hope-Can. IV, 39, 39
13 They meet the poets Homer, Horare, Ovid and Lu an--Can. IV, 83-85.
14 Entering the second circle they see Minos, judging-Can. V, 4.
15 Here they see the punishment of carnal sinners-Can. V, 20.
The author accosts Francesca de Rimini-Can. V, 72.
She tells him how she fell in love with her bro her-in-law-CCan. IV, I23-125.
The surprise of the lovers and their murder by her hasband--Can. V, 123-135.
The anthor, through pity of this sad tale, falls fainting to the ground-Can. V, 137-133.
Entering the THird circle, where olictons are punisued, they encounter Cerberus-Cay. VI, 24-26.
They pass a group lying in mire, drenched by constant hail, snow and discolored water, Cerberus rendering them piecemeal. One of the group, Ciacco, fortells the fate of Florence-Can. VI, 64.
Descent into the fourth circle. Virgil appeases Plutus-Can. VI, 64.
Here one like doom awaits the prodigal and the avaricious-Can. VII, 65-67.
Descent to the Fifth circle, where the wrathfull and gloomy are tormented in the Stygian Lake-CCan. VII, 112-120.
Arr ved at the base of a great tower, Phegyas ferries them over--Can. VIII, 27-29.
On their passage they meet Puillippo Argenti, whose fury and orment is described-Can. VIII, 39-48.
Arrival at the city of Dis (sixtif circle), the entrance whereto is denied by many demons. -Can. VIII, 110-113.
They encounter the hellish furies-Can. IX, 46.
An Angel opens the Gates of Dis to them-Can. IX, 87-59.
Here they find that heretics are punished in Tombs burning with intense Fire-_Can. IX, 124-126.
Dante, by permission of his gaide, holds discourse with Farinata degli Uberti and Cavalcanti. The former predicts the poets exile from Florence--Can. X, 40-42.
Dante arives at the verge of a rocky precipice enclosing the seventa circle. Here he sees the SepuIchre of Pope Anastasius, the Heretic-Can. XI, 8-10.
In the seventh circle the VIolent are punished in a river of blood. The centaurs guard the border of the river and oppose Dante's passagc-Can. XIf, 55-60.

They enter the second compartmeet of the seventh circle, which contains self-destroyers, changed into knotty trees, whereon Harpies build their nests-Can. XIII, 11.
They converse with Pierro delle Vigne, chaucellor to Emperur Erederic II-Can. XIII, 31. The second compartment contains also those who have violently consumed their goods, changed similarly; but chased by black female mastifls-Can. X̀ifli, 126-123.
Arrival at the third compariment of the seventh circle, a plain of dry hot sand where the violent against God, Nature and Abt are punished by showers of eternal fire-Can. SIV, 37-39.

\section*{40}

The euraged demons pursue Dante; but he is saved by Virgil-Can. X.XII, 52-04.

In the NiNTH gulph they see sowers of scandal, scmismatics and heretios differently maimed-Can. XXVIII, 30, 31.
68 They find here Piero da Medicina-Can. XXVIII, 68 seq.
59 Bertrand de Born, beheaded and holding his own head in his hand-Can. XXVIII, 116-119.
63 The author sees more misery in this gulph--Can. XXIX, 1-3.
61 Punishment to forgers in tenth gulph-Can. XXIX, 52-56.
62 They are covered with tetter which they have to scratch off constantly-Can. XXIX, 79-81.
63 Two forgors tormenting each other-XXX, 26-32.
64 Myrrha-Can. XXX, 38, 39.
Arrival in the Ninth cilcle where traitors are confined, is surrounded by giants immerged in pi s to the naval. They enconnter Nimrod-Can. XXXI, 70-72.
66 They meet Ephila'es-Can. XXXI, 85.
67 Anteus takes them both in his arms and places them both at the bottom of the pit-Can. XXXI, 133-135.
68 The ninth and last or frozen circle is divided into four parts. The first is a frozen lake out of which the heads of traitors project-Can. XXXII, 20-25.
69 Dante encounters the traitor Bocca. Can. XXXII, 97-100.
70 How Ugolino chaws the scull of Archbishop Ruggieri-Can. XXXIII, 13-15.
\(7 I\) Ugolino and his Sons starved in tne Tower of Pisa-Can. XLXIII, 62, 63.
72 Ugolino and his Sons iil utter despair-Can. XXXIII, 61-68.
73 The sons all dead, the father dies too. Can. XXXIII. 71-74.
74 Fourth and last round of Nintr circle. Those who have betrayed their benerfactors are wholly covered by ice-Can. XXXIV, 10-13.
75 They lass by a mysterious way again to the upper world--Can. XXXIV, 127-129.
76 Arrive safely under the starry heavens-Can. XXXIV, 133.

\section*{ILIUSTRATIONS TO THE LEGEND OF THE WANDERING JEW.}

\section*{By Gustave Dorm.}

\section*{Finely Colored Photographs.-\$2 7 per Slide.}

1 Christ on his way to Golgatha pronounces judgment on the pitiless Ahasuerus, to wander till Judgment day.
2 Too late he feels, by look, and deed, and word,
How often he has crucified the Lord.
3 Spell-bound, they gather far and near to scan
The weird senescence of that wondrous man.
4 In vain they offer wine with drunken jest;
He may not enter for a moment's rest.

5 On, through morass and slough, he strives to fiy From hateful memories of days gone by.
6 The end releases other men from strife;
His fate is ceaseless tril and deathless life.
7 Now when fantastic visions fill the air
Sorrow surrenders to a dull despair.
8 Transfixed with awe, he feels his God is nigh; And, conscience-stricken, looks on Cavalry.
9 Secure he stands, and fearless gazes round,
Where arrows fall and corpses strew the ground.
10 On thro' the storm he speeds, 'midst drowning crics, Whilst helpless vessels sink before his eyes.
11 Trecs intertwined with snakes he walks beneath, Safe thro' dark valleys ripe with hideous death,
12 The Judgment Day! He hears the trumpets' blast. And, prostrate, owns his Saviour's love at last.

\section*{INSTRUCTIONS FOR THE OXY-HYDROGEN STEREOPTICONS.}

Directions for Mafing tie Hydrogen Gas.-For this purpose a Generator is furnished with the apparatus, consisting of an outer copper tank, with an inner copper drum. This drum has a perforated false bottom-and in the top of it is screwed a brass tube with stop-cock.
Withdraw the copper drum, remove the false bottom, and place within the drum any convenient quantity of Zinc, in small pieces; then replace the falso bottom, and the Zinc will be retained.
Pour in the outer Copper Tank about 4 quarts of water, and add to that about 2 pounds of Snlphuric Acid (common Oil of Vitriol). Stir the mixture with a stick, and let it stand for 15 to 20 minutes, that the acid may be thoroughly and unformly diluted.
Replace the copper drum in the tank, securing it in position by the clamping rods.
Into the Purifier pour water to the depth of about 3 inches. Connect the top opening of the Purifer with the Generator, and the side opening with the Gas Bag (by means of the flexible tubes.)
Turn on the Cock at the Generator, and also that at the Bag.
The Gas will now begin to pass over, and can be seen bubbling up through the water in the Purifier, and the process will continue until the Bag is full, or until the materials in the Generator are exhausted.
After having made the Gas, shut off the Cock at the Bag, and_also that at the Generator,' and detach the Purifier.
Remove the inner copper drum, and wash it and the Zinc with clean water.
Empty the Acid from the Copper Tank-if it is fresh, pour it into a Bottle for future use. But if it is not fresh it is better to throw it away than to run the risk of a failure from poor acid.
Wash the Tank with clean water.
It is recommended to make the Hydrogen in the open uir, to avoid damage to clothing or furniture from the spilling of the acid, which is almost unavoidable.

The Gas furnished by the Public Gas Works answers equally as well as pure Hydrogen Gas. Therefore, in cities and towns where there are Gas Works, the manufacture of Hydrogen can be dispensed with, and the Hydrogen Gas Bag can be filled by making connection between the bag and a gas burner, with a piece of the India Rubber Tubing.

\section*{DIRECTIONS FOR MAEING THE OXYGEN GAS.}

\section*{(The illustration on page 8 represents the apparatus, the Pressure Board of course being removed when making the ( \({ }^{\prime}\) as.)}

Place in the Retort 16 ounces of Chlorate of Potash, in coarse powder, and add to it 6 ouncea of Black Oxide of Man7anese. Shake the Retort, that the ingredients may be well mixed.
Next, blow through all the pipes and connections, so as to satisfy yourself that there is nothing to obstruct the free passage of the Gas.
Pour about one pint of water into the wash bottle, and fit the metal pipe into the opening at the top; this pipe is connected by the India Rubber Tubing with the longer metal pipe which you now fit into the top of the Retort. Press these pipes, and the fittings will be completely gas-tight.

Light the spirit lamp under the Retort, and in a few minutes bubbles of gas will begin to come ap through the water in the Wash Bottle, and the Wash Bottle is now to be connected with the Gas Bag by the piece of India Rubber Tubing, as shown in the illustration.
If the Gas comes over too violently, remove the lamp and replace it when the flow of gas becomes more moderate, and keep it under the Retort until the bubbles cease to come over.

You then turn the cock at the Bag-detach the Bag from the Wash Bottle. Next, remove the metal pipe from the Wash Bottle-and, last of all, remove the Spirit Lamp.
When the Retort has cooled, wash out the residuum in the Retort, and stand the Retort upside down, that it may be entirely dry before it is used again, as it is absolutely necessary that there shall be no moisture in the Retort while the Gas is being made. With good chemicals the Bag can be filled with Gas in about twenty minutes.
Failures often occur from using impure chemicals. To test them, melt a small quantity of the Cblorate of Potash, in an iron spoon, over a Spirit Lamp, and stir into it with an iron wire some of the Black Oxide of Manganese.
If the materials are not good an explosion will take place, and a whitish mass with red spots in it will be left in the spoon-if they are pure, there will be no explosion, and the melted mixture will soon dry up, leaving a dark gray residuum.
For price of Chemicals, etc., see price list on page 48.

\section*{DIRECTIONS FOR SETTING UP AND OPERATING THE OXY•HYDROGEN STEREOPIICON.}

The Oxy-Hydrogen Stereopticon is packed in a substantial, hinged Packing Case, with Lock and Key, about 24 inches square, and 30 inches long, dovetailed, and planed smootl inside and outside. This contains the Stereupticon, with Gas Bags, etc., complete, and also affords sufficient space for"the sliders and screen. The lid of the box is made with slip hinges, so that it can be removed in au instant. This lid serves as a platform for the apparatus, and to the inner side of it is attached the dissolving key, etc.

The first thing to be done is to put up the Screen (on page 48 is price list of Screens). The Screens are made with a wide hem, and with loops placed two feet apart all around the tour sides of the Screen. By these loops the Screen can be attached to a wooden frame, though permaps the most convenient plan is to pass a rope or stout cord through the loops on the upper edge of the screen, and suspend the rope from the sides of the room or hall; if in a church, the rope can generally be attached to the side windows or galleries. Tie the loop at the upper left hand corner to the cord or rope, and to the loop at the upper right hand corner attach a light cord, by drawing which the Screen can be stretched eveniy; and by the loops on the sides and lower edge, it can be held firmly. Before hanging it up it should be dipped in water, as this will render it closer, and more transparent, and therefore show the views to better effect. The apparatus can be placed either in front of the Screen or behind it, as may be most convenient, depending upon the proportions and internal arrangements of the room or hall.
the size to which the picture is to be magnified is next to be determined. The further the apparatus is from the Screen, the larger will be the picture on the Screen. The apparatus is furnished with a set of Low Power, and also a set of High Power Magnifying Lenses, giving about the following results. The Low Power Lenses, with the Screen at the

And the High Power Lenses, with the Screen at the
Distance of 10 feet from the apparatus, will make a picture of about. . . . . . . . . 6 feet diametor

The apparatus must be at a proper distance from the Screen to produce the views of the desired dmensions, and elevated from the fioor, so that the lenses shall be on a level with the centre of the Screen. Th s can generally be accomplished by placing the packing case on its side on a desk or table, slipping the lid off its hinges, and placing this on the side of the packing case. The lid is intended to serve as a platform, the Dissolving Key, etc., being permanently attached to it, while the views to be used in the exhibition can be conveniently placed within the case.

Place the Lanterns on the Platform, each on its own pivot. Set the Safety Bottles in their sockets, having water in each to the depth of about one inch.

Place the Oxy-Hydrogen jets in the Lanterns with a cylinder of good hard lime in the lime carrier of each.

On the floor in front of the apparatus place the Gas Bags, each under its pressure board. On the Oxygen Bag there should be about 200 pounds weight, and the same on the Hydrogen if house gas is used; if, however, pure Hydrogen (made from Zınc and Sulphuric Acid) is used, there should then be from 250 to 300 pounds weight on the Hydrogen.

The best way to provide the weights for a traveling exhibition is to procure two good stout Bags, such as are used for grain or salt, and carry these along with the apparatus, and fill them with dirt or sand, which can be thrown out at the close of the performance, and the Bags packed up with the apparatus.

With the long flexible tabe marked HYD, connect the Hydrogen Bag with the top opening of the Hydrogen Safety Bottle-then connect the side opening of the same with the Dissolving Key, and that again winh the cock of tach jet malked \(H\). All the flexible tubes which form the Hydrugen connections are distinctly marktd \(1 Y D\) at each end.

With the long flexible tabe marked OXY, connect the Oxygen Bag with the top opening of the Oxygen Safety Bottle, then connect the side opening of the same with the Dissolving Key, and that again with the cock of each jet marked 0 . All the flexible tubes which forn the Oxygen connections are distinctly marked \(O X Y\) at each end.

Turn the cock at each Bag, and also the cocks at the jets full head on, and set the lever of the Dissolving Key so as to send the gases equally to each jet.

If the pipes are all clear and unobstructed, the gases will be seen bubhling up throngh the Water in each of the Satety Bottles. Move the lever of the Dissolving Key from side to side, and notice if the bubbles in each of the Safe, y Bottles continue to come up without interruption (If there is any interruption, the tubes must be detached and examined, as well as the jets, to. ascertain where the obstruction is, and to remove the canse.) Allow the gases to pass through in this way for the space of about one minute, so as to expel all the atmospheric air from the tubes.

Then stop the Gases at each jet, and turn on a little Hydrogen to each jet (by the cocks marked H ), and light it with a match as it issues from the jet. Allow the Hydrogen to hurn thus for about two minutes, that the lime cylinders may be gradually heated up; the Lime Cylinders generally require to be about \(\frac{t}{\delta}\) inch from the jet, but this will var \(r\) with differ-nt samples of lime; the lime carriers therfore are mounted on a sliding bar for ease of adjustment.

Move the Lever of the Dissolving Key to the right, until it is stopped by the Pin. This will send almost all the flow of each Gas to the Jet in the Right Hand Lantern, thus reducing the flame in the Left Hand Lantern to a small size-merely enongh to keep up the light.

Next, turn on very gradually the Oxyaen to the Jet in the Right Hand Lantern (by the cock attached thereto marked 0 ), and then increase the flow of each gas very gradualy, nntil the light is briltiant and dazzling. To obtain this requires the gases to be very delicately proportioned to each other-too much, either of Oxygen or of Hydrogen, will reduce t'e intensity of the light and waste gas. When the light is perfect, there will be scarcely an flame visible, but the front surface of the Lime Cylinder will be of such a dazzling briglitness that the eye cannot look directly at it without injury. Never look, therefore, at the lime itself, but observe it \(\&\) reflection in the condensing lens, and its condition can be seen exactly. Always follow this rule.

Then move the Lever of the Dissolving Key to the extreme left, and adjust the jet in the Left Hand Lantern, in the same way as directed above.

Place a View in the Left Hand Lantern, and adjust the focus.
Move the jet back and forth from the Condensing Lenses, and slide it up and down on the rod until the picture on the screen is evenly illuminated, then secure it by the clamping screw.

Move the Lever of the Dissolving Key, and transfer the Gases to the jet in the Right Hand Lantern.
Place a View in the Right Hand Lantern, adjust the focus, and adjust the jet as directed above.
Turn the Lever of the Dissolving Key half way, and each picture will be seen on the screen. Move the Lanterns on the pivct in front, so as to bring both pictures on the same space.
Then by moving the Lever of the Dissolving Key from one side to the other, 1hereby transfering the gases from one jet to the other, the pictures will beautifully dissolve, one into the other-one will fade away, and the other replace it on the screen in a manner which never fails to astonish and delight an audience.

While a picture in one lantern is before the audience, and the explanation of it is being made, quietly withdraw the slide from the other lantern, and replace it by another, and dissolve by moving the lever of the Dissolving Key. To show Statuary upon a colored ground, place the colored Glass Slide in one lantern, which will produce a colored screen-then place a statuary Slide in the other lantern, and move the lever of the Dissolving Key, and the statuary will appear on the colored background, and can be slowly dissolved out in the same way.
The Lime Cylinder must be turned occasionally during the exhibition, to present a new surfaoe -and the proportions of the gases will require adjusting every now and theu.

At the close of the exhibition, or if it should be necessary during the exinibition to make any change in the position of the Gas Bags, turn off both gases-the Oxygen first, and then tise Hydrogen.

\section*{MATERIALS, Etc.}
Lime Cylin lers, prepared from fine Peunsylvania Marwle, for Oxyhydrogen Stereopticons,
 Lime Squares, prepared from fine Pennsylvania Marble for Oxy Calcium Stereopticcn's in 200 in Tin air-tight canisters, containing 12 limes............................................... canister 200
Chlorate of Potash, chemically pure, per pound.
black Oxile of Manganese, chemirally pure, per pound.
Chemicals, ready mixed, in Packages-each package containing proper quantity to make
Gas sufficient for an evening's exhibition-per package
100
First qualty ludia Rubber lias Bag, 24 by 30 jnches-with Stop Cocls, each,...................................... 40
First quanty ludia Ruaber Gas Bag, 30 by 40 inches-with Stop Cock, each, ............... 2400
India Rubber Tubing, per foot,............................................................................... 50
Improved Lamp to !urn Lard, or Lard Oil, with Reflector, each,............................... 500
Glass Chimney, for do....................................................................................................... 250
Coal Oil Lamp, each............................................................................................................. 25
Glass Chimney, for do.................................................................................................................. \(1_{0}\)
Scissors, for trimming Lamps............................................................................ 100
Wicks, for do. per dozen,............................................................................................... 000

Magnesium Lamps, for burning Magnesium Wire.............................\$50 00
Magnesium Wire, for above Iıamps. . . . . . . . . . . . . . . . . . . . . . . . . . per ounce \(\$ 350\)
These Magnesium Lamps can be attached to any of the Lanterns or Stereopticons. They give a brilliant light, but give out an abundance of smoke, which must be led off to a chimney and the oxpense of burning each Lamp is about \(\$ 3\). Mo per Lour.

\section*{T. II. Mcallister's Household Microscope. \\ 
 Price, \(\$ 5.00\).}

\section*{Boys' and Girls' Magic Lantern,}

\author{
THEE BEST IMEOR'NED ARTICLAE.
}

\section*{BLACK JAPANNED LANTERNS}

WITH LAMP TO BURN LARD OIL, SWEET OIL, OR SPERM OIL.

\section*{Kerosene Oil must not be used in these Lanterns.}

Each Lantern accompanied with six Long Slides on double glass, containing from five to six Comic subjects on each slide-and three Revolving Firework Slides.

No. 1, with Condensing Lenses, \(13-4\) inches diameter, \(\$ 5.00\) No. 2, with Condensing Lenses, 2 inches diameter, \(\quad 7.50\) No. 3, with Condensing Lenses, \(21-4\) inches diameter, 10.00
